

IT'S YOUR TURN TO GROSS YOUR KIDS OUT TONIGHT.

Just tell them that if they take meth, all this can happen: Nausea and vomiting, diarrhea, hallucinations (like thinking bugs are crawling beneath your skin), convulsions, damaged blood vessels, paranoia, violent behavior, insomnia, addiction, hyperthermia, forgetting to eat and sleep, weight loss, malnutrition, rapid and irregular heartbeat, increased blood pressure, stroke. And yes, death.

METH KILLS. TELL YOUR KIDS.
