A **Risk Score** estimates the client's expected future medical costs given their risk factors: gender, age, diagnoses and medications. The information is based on fee-for-service and managed care encounter claims data from the past 15 months (24 months for children).

Interpretation: If a client has a risk score of 1.5 that means that their expected medical expenditures in the next year are expected to be 50% greater than the average Medicaid client in the SSI blind/disabled category.

The risk score is only a starting point – Don't take the numeric value too literally. A client with a score of 1.20 will generally be less complex than a client with a score of 7.0, but the differences between 1.2 and 1.3 are likely to be negligible from a care management perspective. The score can vary somewhat every week, based on changes in age or new claims being processed. However, once a Medicaid client is identified as "clinically qualified", they stay qualified regardless of their PRISM score.

A risk score can be broken down into **risk factors**. Risk factors include diagnoses grouped together based on disease category. The diagnosis groups are further broken down by the degree of increased expenditures associated with that group, such as "high cost, medium cost, low cost". The risk factors are provided to assist you in identifying the multitude needs of the client.

Outpatient ER
View as PDF

Service Start Date	Primary Diagnosis	Paid	NE	EPCT	EPCP	ENP	Alcohol	Drug	Injury	Psych	Other	Provider	E Codes
2012-10-21	DIABETES W/O COMPLICATION, UNCONTROLLED	\$2,067.57			100%							ANYTOWN REGIONAL MED AND HEART CTR	
2012-10-12	DIABETES W/O COMPLICATION	\$460.41	60%	6%	34%							ANYTOWN REGIONAL MED AND HEART CTR	
2012-10-09	ORTHOSTATIC HYPOTENSION	\$365.12									yes	ANYTOWN REGIONAL MED AND HEART CTR	

Four columns indicate the probability that the Emergency Room visit is:

NE - Non Emergent. The patient's initial complaint, symptoms, vitals, history and age indicated that medical care was not required within the next 12 hours;

EPCT - Emergent: Primary Care Treatable. Treatment was required within 12 hours and could have been provided outside of the ER;

EPCP - Emergent: Emergency Room Care Needed, Illness Preventable. The health episode could have been avoided with timely primary care treatment; and/or

ENP - Emergent: Emergency Room Care Needed, Not Preventable health episode could not have been avoided.

Interpretation: The first ER visit here, Chest Pain NOS has a 32% probability of being **Emergent, Primary Care Treatable** and a 68% probability of being **Emergent, Emergency Room Care Needed, Not Preventable** based on a study conducted by New York University (<http://wagner.nyu.edu/chpsr/index.html?p=62>).

Five (5) types of ER visits do not have a prevention probability assigned to them; they are just assigned a group based on the diagnosis code: Alcohol, Drug (excluding alcohol), Injury, Psych or Other.

These categories can help you quickly scan the list to determine which visits may have been avoidable or determine patterns of ER visits.
