Division of Behavioral Health and Recovery

**Chris Imhoff, Director**

---

**RDA** Research & Data  
Analysis Division

These tables provide a comprehensive update of data published in previous *Profiles*. They are among the timeliest data available to planners for understanding the risks of substance abuse among youth in their counties. Community, family, peer, and school-related factors are presented within the Hawkins and Catalano risk and protective factor framework that is used by many substance abuse prevention planners across the country.

For more information about the data, framework, definitions, and other topics, see the 1997 *Profile on Risk and Protection for Substance Abuse Prevention Planning in Washington State*, (Report 4.15-40). That report and subsequent years' Profiles are available on the RDA website at [www1.dshs.wa.gov/rda/research/risk.shtm](http://www1.dshs.wa.gov/rda/research/risk.shtm).

## Walla Walla County

#### **Introduction**

Interpreting Indicator Profiles:

Interpreting Annual Trend Charts:

**Indicator Comparison Profiles:** (A comparison of standardized five-year rates at county and 'county like us' levels by domain, factor, and indicator)

1. Indicator Profile 1
2. Indicator Profile 2
3. Indicator Profile 3
4. Indicator Profile 4

#### **Community:**

5. Availability of Drugs
6. Extreme Economic & Social Deprivation
7. Transitions & Mobility
8. Antisocial Behavior of Community Adults
9. Low Neighborhood Attachment and Community Disorganization

#### **Family:**

10. Family Problems

#### **Schools:**

11. Academic Achievement
12. School Climate

#### **Individual/Peer:**

13. Early Criminal Justice Involvement

#### **Problem Outcomes:**

14. Child and Family Health
15. Criminal Justice
16. Substance Use

#### **Appendices**

17. Technical Notes
18. Populations Subtracted for Police Agencies not Reporting Arrests to UCR
19. Police Agencies that did not Report Arrests to UCR

## **Understanding the CORE Trend Charts and Tables**

The presentation of risk factor data in the CORE reports is organized by domain (Community, Family, School, and Individual/Peer) and by risk factor within domains. Each risk factor may include one or more indicators.

Knowing that your county has a particular rate for one of the indicators does not help you evaluate the importance of that indicator to your risk profile. You do not know if it is higher or lower than you could reasonably expect. It is more useful to compare your county rate to the state rate, which is the average for the whole state, and to other counties, especially counties that have some characteristics in common with your county. This is especially important when urban rates differ substantially from rural rates. The comparison we present is for a group of counties that are similar in characteristics related to prevention planning: population of young people (aged 10-24), the percentage of deaths in the county that are alcohol and drug-related, and a simple geographic division into Eastern and Western Washington. For each indicator the **Counties Like Us** rate is the average rate across all of the counties in the cluster. For more information on Counties Like Us see the Technical Notes.

### **Please note these IMPORTANT ISSUES:**

The tabs are labeled with the name of the risk factor. Each risk factor may in turn include several indicators. Be sure to **scroll down the page** to review all of the available indicators for a given risk factor. The workbook is designed to print with one indicator on each page.

### Understanding the chart scales:

Users should be careful to interpret the chart scales correctly. The chart scales are automatically adjusted to enhance differences between the indicators at each geographic level. Users should consider whether the differences they observe between geographic areas or across years are significant. The unit of measurement is displayed at the left of each chart scale. Often the unit of measurement is a rate expressed as the number of events or a count of individuals per 100 population (or, "percent"), or sometimes per 1,000 or 100,000 population.

Review the example:

On the following page (below, scroll down) is an example indicator for Alcohol Retail Licenses in "Cascadia County" . The number of alcohol retail licenses is expressed as a rate per 1,000 population.

Each risk factor is on its separate tab. Each risk factor may include several indicators, so **remember** to page down. For example, the risk factor *Availability of Drugs* has two indicators: Alcohol Retail Licenses (shown below) and Tobacco Retail And Vending Machine Licenses.

**Alcohol Retail Licenses**

	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
National	Comparable National Data Not Available											
State	2.12	2.06	2.03	2.01	2.01	2.01	2.00	1.98	1.96	1.91	1.91	1.91
Counties Like Us	3.27	3.12	3.11	3.08	2.98	3.00	2.96	2.88	2.77	3.17	3.17	3.17
Cascadia County	5.08	5.23	5.22	5.22	5.29	5.35	4.86	4.99	4.32	5.93	5.93	5.93
Licenses	32	34	35	36	37	38	35	35	31	43	43	43
All Persons	6,295	6,497	6,703	6,899	7,000	7,103	7,198	7,012	7,177	7,250	7,250	7,250

**Note:** The State and County rate are the annual number of alcohol retail licenses active during the year, per 1,000 persons (all ages). Retail licenses include restaurants, grocery stores, and wine shops but do not include state liquor stores and agencies. Retail alcohol facilities on military bases and reservations are not licensed by the State and therefore are not included in these data.

**State Source:** Washington State Liquor Control Board, Annual Operations Report  
**Population Estimates:** Washington State Department of Health

Each indicator graph is followed by data source and rate definitions as well as any special information for the data.

**--Rate Formula--**  
 Rate = (numerator / denominator) x factor  
*Example in 1998:* (32 / 6,295) x 1,000 = 5.08  
 Read the rate as 5.08 licenses per 1,000 people.

Updated

## Standardized Five-Year Indicator Profile

*Note: Check other Domains for substance use of community adults and early teens.*

Community Domain: Availability of Drugs

Alcohol Retail Licenses

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
State	1.92	1.90	1.88	1.90	1.92	1.96	1.97	1.95	1.96	1.97	1.99	2.15
Counties Like Us	2.41	2.42	2.43	2.44	2.42	2.49	2.44	2.44	2.52	2.49	2.55	2.70
Walla Walla County	1.47	1.47	1.58	1.62	1.58	1.61	1.69	1.73	1.92	1.81	1.91	2.18
Licenses	81	81	87	90	88	91	97	100	112	106	113	128
All Persons	55,108	55,180	55,200	55,406	55,800	56,696	57,500	57,888	58,300	58,591	59,200	58,781

**Note:** The alcohol retail licenses active during the year, per 1,000 persons (all ages). Retail licenses include restaurants, grocery stores, and wine shops but do not include state liquor stores and agencies. Retail alcohol facilities on military bases and reservations are not licensed by the State and therefore are not included in these data. Policies on licensing distributors, taxing the proceeds, and determining who can sell alcohol vary substantially from state to state. Consequently, there is no consistent comparable source for national data. Data from 1999 to present is now geocoded from the facility address, rather than apportioned from zip code. This results in a more accurate, but different data total per county.

Net Migration, 3 Year Moving Average

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
State	8.79	6.81	6.43	5.71	5.39	4.82	5.82	8.80	10.51	10.63	8.38	6.09
Counties Like Us	6.72	1.66	0.19	-0.99	1.80	4.00	6.18	8.83	9.15	8.66	6.73	6.38
Walla Walla County	-3.27	-3.41	-4.84	-1.19	0.81	5.68	9.15	8.90	6.45	3.89	4.97	4.90
Net Migration	-180	-188	-267	-66	45	322	526	515	376	228	294	288
All Persons	55,108	55,180	55,200	55,406	55,800	56,696	57,500	57,888	58,300	58,591	59,200	58,781

**Note:** Net migration is the annual number of new residents that moved into an area minus the number of residents that moved out of an area. In Washington, the Office of Financial Management estimates annual net migration for twelve months ending on March 31st of a given year. For example, annual net migration in 2009 refers to the period from April 1, 2008 through March 31, 2009. Net migration can change a lot from year to year; calculating a 3-year moving average smoothes net migration. The net migration rate in Year 3 is equal to the average of net migration in Years 1, 2, and 3, divided by the total population in Year 3. The result is then multiplied by 1,000 to measure net migration rate per 1,000 persons.

Adjusted Pop 18+	41,360	41,617	41,773	42,080	42,548	43,395	44,126	44,541	44,948	45,308	45,914	45,541

**Note:** The alcohol violations (age 18+), per 1,000 adults (age 18+). Alcohol violations include all crimes involving driving under the influence, liquor law violations, and drunkenness. DUI arrests by the Washington State Patrol are included in the state trend analysis. However, they are not included in the county rankings since WSP arrests are not assigned to counties. Denominators are adjusted by subtracting the population of police agencies that did not report arrests to UCR. In spite of this population adjustment, when the non-reporting police jurisdiction is where much of the crime occurs, the rate for the county will be lower than it would be if that jurisdiction was included. For percent subtracted, suppression code definitions and the agencies not reporting, see the Technical Notes and the appendix on Non-Reporting Agencies and Population.

**Prisoners in State Correctional Systems (Age 18+)**

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National	476.00	478.00	470.00	476.00	482.00	486.00	491.00	501.00	506.00	509.00	502.00	
State	116.8	117.7	125.9	143.1	198.1	291.9	349.0	369.2	413.6	404.3	400.3	400.4
Counties Like Us	90.8	90.3	97.0	120.6	152.2	189.1	241.6	268.3	314.1	315.7	300.9	303.5
Walla Walla County	98.0	87.0	121.4	131.8	206.1	266.3	453.9	419.8	471.7	483.0	457.8	427.0
Prisoners, 18+	54.0	48.0	67.0	73.0	115.0	151.0	261.0	243.0	275.0	283.0	271.0	251.0
All Persons	55108.0	55180.0	55200.0	55406.0	55800.0	56696.0	57500.0	57888.0	58300.0	58591.0	59200.0	58781.0

**Note:** The adult (age 18 and over) admissions to prison, per 100,000 persons (all ages). Admissions include new admissions, re-admissions, community custody inmate violations, and parole violations. Counts of admissions are duplicated so that individuals admitted to prison more than once in a year are counted each time they are admitted. The admissions are attributed to the county where the conviction occurred. In 2003 prisoners being electronically monitored are included in the data. This causes a jump in numbers for counties which use this incarceration option. Suppression code definitions for yearly rates are explained in Technical Notes.

## Family Domain: Family Problems

### Divorce

**Note:** The divorces per 1,000 persons (age 15 and over). Divorce includes dissolutions, annulments, and unknown decree types; it does not include legal separations. Divorce data is reported by the woman's residence, if in Washington at the time of decree. If the woman lived outside Washington, the man's residence was used. If both parties residence was unknown the event is not assigned to a county, but is included in the state rate. The National rate is based on age 18 and over population. Suppression code definitions for yearly rates are explained in Technical Notes.

**State Source:** Department of Health, Center for Health Statistics, Dissolution and Annulment Data. Population Estimates: Washington State Department of Health

**National Source:** Calculated using Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, National Vital Statistics Reports Births, Marriages, Divorces, and Deaths, Provisional Data

Tested, 10th grade	737	604	734	705	673	667	510	600	543	475	898	589

**Note:** The students tested who failed one or more content areas as a percent of all students tested at the 10th grade level. Some districts have chosen to test students in both grades 9 and 10 for the 10th grade assessment. All students being tested at the 10th grade level are included in these data regardless of their grade placement. Tests are given in the spring of the year. For example, data for 2008 is for students in the 10th grade during the school year 2007/2008. By contractual agreement data is suppressed when less than ten students were tested to avoid individual student identification.

In 2009-10 the tenth grade WASL was replaced by the High School Proficiency Exam (HSPE). This test was built on the same framework as the WASL, but contain fewer questions. It is considered equivalent by OSPI.

By contractual agreement data is suppressed when less than ten students were tested to avoid individual student identification.

In 2009-10 the 4th grade WASL was replaced by Measurements of Student Progress (MSP). This test was built on the same framework as the WASL, but contain fewer questions. It is considered equivalent by OSPI.

### High school Cohort (Cumulative) Dropouts

Percent

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National								15.10	16.70	15.70		
State								21.43	21.01	21.39	19.43	17.62
Counties Like Us								17.96	19.50	19.44	19.90	17.10
Walla Walla County								13.20	12.67	14.22	8.09	8.74

**Note:** A cumulative or cohort dropout rate is based on the percentage of students who began grade 9 in a given year but dropped out of school over a four-year period and did not receive a high school diploma. The Cohort (Cumulative) Dropout Rate formula is:  $100 - (100 * (1 - \text{grade 9 dropout rate}) * (1 - \text{grade 10 dropout rate}) * (1 - \text{grade 11 dropout rate}) * (1 - \text{grade 12 dropout rate}))$ . Due to the complexity of this formula numerators and denominators have not been listed here, but are available at <http://www.k12.wa.us/DataAdmin/pubdocs/GradDropout/>.

**State Source:** Office of Superintendent of Public Instruction, Graduation and Dropout Statistics for Washington.

Updated  
8/23/2011

**Annual (Event) Dropouts**

**Note:** The proportion of students enrolled in grades 9-12 who drop out in a single year without completing high school. This indicator answers the question "How many high-school students left school without graduating this year?". This is the total number of students that drop out of school from grades 9 through 12, divided by the total number of students in grades 9 through 12, less the number of students that transferred out of the district/school. Additional Information on using academic indicators is available in technical notes. More information about graduation and dropout rates in Washington State can be found online at: <http://www.k12.wa.us/dataadmin>.

**State Source:** Office of Superintendent of Public Instruction, Graduation and Dropout Statistics for Washington.

**On-time Graduation**

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National								73.40	73.90	74.70	75.50	
State								70.45	72.47	72.03	73.53	76.46
Counties Like Us								71.19	74.48	72.58	73.46	76.67
Walla Walla County								75.20	74.94	72.96	88.31	87.70

**Note:** The percent of students who graduate in four years to complete their degree. The Washington State Board of Education establishes minimum credit requirements, the Culminating Project and the High School and Beyond Plan. The Washington State Legislature requires state testing. To earn a high school diploma, a student must:

- Earn high school credit
- Pass state tests or approved alternatives to those tests
- Complete a Culminating Project
- Complete a High School and Beyond Plan.

The On-Time Graduation Rate formula is:  $100 * (1 - \text{grade 9 dropout rate}) * (1 - \text{grade 10 dropout rate}) * (1 - \text{grade 11 dropout rate}) * (1 - \text{grade 12 dropout rate} - \text{grade 12 continuing rate})$ . Due to the complexity of this formula numerators and denominators have not been listed here, but are available at <http://www.k12.wa.us/DataAdmin/pubdocs/GradDropout/>. Additional Information on using academic indicators is available in technical notes.

**Extended Graduation**

State							75.12	77.47	77.05	79.23	82.62
Counties Like Us							75.86	80.61	77.13	78.95	82.54
Walla Walla County							85.90	83.15	78.65	94.58	100.48

**Note:** The percent of students who graduate including those students who stay in school and take more than four years to complete their degree. The Extended Graduation formula is: (the number of on-time and late graduates)/(the number of on-time graduates divided by the on-time graduation rate). A large difference in the size of the on-time and extended graduation rates may indicate that a district or school is working hard to keep students in school or to have dropouts return to school and graduate. Additional Information on using academic indicators is available in technical notes.

### Unexcused Absences for Students in Grades 1 to 8

Percent

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
State					4.53	4.15	4.28	3.91	3.82	3.76	3.61	3.80
Counties Like Us					2.20	1.81	5.95	2.06	2.19	1.84	1.70	1.73
Walla Walla County					1.54	2.30	26.43	2.88	3.17	2.67	2.55	2.88
Unexcused Absences					1,382	2,120	23,872	2,459	2,821	2,362	2,254	2,598
Potential Days					900,103	923,359	903,097	852,407	890,179	883,735	884,156	901,779

**Note:** The unexcused absences for students in grades 1-8 as a percent of the total student days possible. Potential school days are the number of days students were taught from the first day of school through May 31 in each school building multiplied by the net served students in grades 1-8 in that building. The definition of an unexcused absence is a local decision, so the definition differs among schools and districts. In general, a student who has an unexcused absence has not attended a majority of hours or periods in a school day, or has not complied with a more restrictive district policy, and has not met the conditions for an excused absence (see RCW 28A.225.020).

**Arrests (Age 10-14), Alcohol- or Drug-Related**

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National	2.66	2.52	2.81	2.50	2.30	2.29	2.11	2.17	2.13	2.01	1.95	
State	3.73	3.64	3.48	3.05	3.07	2.95	2.62	2.64	2.71	2.42	2.45	2.84
Counties Like Us	5.33	5.55	5.00	3.51	5.69	4.22	3.52	3.01	4.33	3.20	2.93	2.69
Walla Walla County	3.27	6.29	5.55	3.27	6.29	6.04	3.30	3.10	2.11	1.34	2.68	2.13
Arrests, 10-14	13	25	22	13	25	24	13	12	8	5	10	8
Adjusted Pop 10-14	3,974	3,974	3,965	3,974	3,973	3,975	3,937	3,865	3,798	3,737	3,732	3,764

**Note:** The arrests of younger adolescents (age 10-14) for alcohol and drug law violations, per 1,000 adolescents (age 10-14). Alcohol violations include all crimes involving driving under the influence, liquor law violations, and drunkenness. For children, arrests for liquor law violations are usually arrests for minor in possession. Drug law violations include all crimes involving sale, manufacturing, and possession of drugs.

1) Denominators are adjusted by subtracting the population of police agencies that did not report arrests to Uniform Crime Report (UCR). In spite of this population adjustment, when the non-reporting police jurisdiction is where much of the crime occurs, the rate for the county will be lower than it would be if that jurisdiction was included. For percent subtracted, suppression code definitions and the agencies not reporting, see the Technical Notes and the appendix on Non-Reporting Agencies and Population.

2) The DUI portion of this measure is likely understated, because arrests made by the State Patrol are not attributable to counties. State Patrol arrests are included in the state rates.

Offenses, Domestic Violence

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
State	6.86	6.92	6.77	6.51	6.51	6.46	6.47	6.06	5.79	5.32	5.67	5.65
Counties Like Us	6.01	6.07	5.82	5.13	5.70	5.74	5.54	4.80	4.25	4.66	4.95	5.31
Walla Walla County	6.15	6.32	6.21	5.31	6.52	6.16	6.47	4.77	4.29	4.18	5.10	4.87
Offenses	339	349	343	294	364	349	372	276	250	245	302	286
Persons	55,108	55,180	55,200	55,406	55,800	56,696	57,500	57,888	58,300	58,591	59,200	58,781

**Note:** The domestic violence-related offenses, per 1,000 persons. Domestic violence includes any violence of one family member against another family member. Family can include spouses, former spouses, parents who have children in common regardless of marital status, adults who live in the same household, as well as parents and their children.

Offenses differ from arrests. While funding and grants are associated with participation, reporting is not mandatory. Offenses are incidence reporting. When more than one victim is involved an offence is filed for each victim. Multiple property violations performed at the same incident are counted as one offence. However when both types of events happen, only the victim incidents are reported as offenses. Offenses focus on the nature of the crime, while arrests focus on the apprehended accused perpetrator. Many offenses occur without arresting perpetrators.

Denominators are adjusted by subtracting the population of police agencies that did not report offenses. In spite of this population adjustment, when the non-reporting police jurisdiction is where much of the crime occurs, the rate for the county will be lower than it would be if that jurisdiction was included. For percent subtracted and the agencies not reporting, see the appendix on Non-Reporting Agencies and Population. Suppression code definitions for yearly rates are explained in Technical Notes.

### Alcohol-Related Traffic Fatalities Per All Traffic Fatalities

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National	35.45	37.54	37.28	36.72	35.96	35.74	38.15	37.39	37.65	37.16	45.35	
State	38.15	39.30	37.44	39.82	36.83	37.74	41.76	39.65	40.81	43.57	49.08	40.87
Counties Like Us	39.74	37.97	35.06	43.24	25.97	34.48	34.55	45.45	41.38	37.29	55.00	36.96
Walla Walla County	33.33	66.67	62.50	81.25	0.00	25.00	20.00	66.67	33.33	0.00	100.00	20.00
Alcohol-related	4	6	5	13	0	1	1	4	4	0	4	1
Fatalities	12	9	8	16	8	4	5	6	12	6	4	5

**Note:** The alcohol-related traffic fatalities, per 100 traffic fatalities. "Alcohol-related" means that the officer on the scene determined that at least one driver involved in the accident "had been drinking." Thus, "Alcohol-related" includes but is not limited to the legal definition of driving under the influence. Care should be taken since small numbers of events can cause unreliable rates in some counties.

**Arrests (Age 10-17), Alcohol Violation**

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
National	6.66	5.98	6.02	6.38	5.25	4.94	4.72	5.27	5.31	4.98	4.32	
State	9.66	9.03	8.13	7.79	7.81	7.36	6.46	7.44	7.70	6.72	5.81	4.82
Counties Like Us	18.93	17.65	15.18	13.88	15.37	13.02	8.50	9.60	11.04	9.43	7.56	5.14
Walla Walla County	11.86	13.74	12.69	9.73	10.82	9.39	6.70	7.53	6.64	4.98	6.98	6.87
Arrests, 10-17	76	88	81	62	69	60	43	48	42	31	43	42
Adjusted Pop 10-17	6,409	6,403	6,382	6,374	6,376	6,391	6,415	6,376	6,325	6,224	6,159	6,114

**Note:** The arrests of adolescents (age 10-17) for alcohol violations, per 1,000 adolescents (age 10-17). Alcohol violations include all crimes involving driving under the influence, liquor law violations, and drunkenness. For children, arrests for liquor law violations are usually arrests for minor in possession.

1) Denominators are adjusted by subtracting the population of police agencies that did not report arrests to UCR. In spite of this population adjustment, when the non-reporting police jurisdiction is where much of the crime occurs, the rate for the county will be lower than it would be if that jurisdiction was included. For percent subtracted, suppression code definitions and the agencies not reporting, see the Technical Notes and the appendix on Non-Reporting Agencies and Population.

2) The DUI portion of this measure is likely understated, because arrests made by the State Patrol are not attributable to counties. State Patrol arrests are included in the state rates.

**Counting Alcohol- or Drug-related Deaths**

AOD deaths are identified by matching all the contributory causes of death from death certificate records to a list of causes that are considered AOD-related. The deaths identified as AOD-related then may be summed to provide area totals. Dividing the total AOD-related deaths by all deaths in an area gives the percent of all deaths that are alcohol and drug related. Lists of underlying causes of death that are AOD-related have been developed in several studies. Citations for these studies are listed prior to the AOD attribution tables. AOD-related deaths used in this report are determined using a comprehensive assembly of disease, accident, and injury codes identified in those studies. The codes are based upon the International Classification of Diseases, Ninth Revision (ICD-9) from 1990 to 1998 or International Classification of Diseases, Tenth Revision (ICD-10) after 1998.

The identified AOD-related causes of death may be either fully attributable or sometimes attributable to alcohol or drugs. Some contributory causes of death are explicit in their mention of alcohol or drugs. Examples include alcoholic cirrhosis of the liver (ICD-9 code 571.2), alcohol and drug dependence syndromes (ICD-9 codes 303 and 304, respectively), and drug poisonings (ICD-9 codes E850 through E859). All deaths of this sort are fully, or 100%, attributable to alcohol or drug abuse and are considered direct AOD-related deaths.

Other contributory causes of death are related only sometimes to alcohol or drugs. For example, epidemiological studies have shown that, among persons over 35 years of age, 60% of deaths due to chronic pancreatitis (ICD-9 code 577.1) and 75% of malignant neoplasms of the esophagus (ICD-9 code 150) are alcohol-related. For persons of all ages, 42% of motor vehicle traffic and nontraffic deaths (ICD-9 codes E810 through E825) are alcohol-related. The appropriate percentage of such indirectly attributable deaths are also counted toward totals for AOD-related deaths.

The tables on the following pages characterize the different diseases, injuries, and accidents by: name, ICD-9 or ICD-10 code, percent attributable to alcohol or drugs, age of inclusion. Information sources are listed below.

## Uniform Crime Report - Non-Reporting Police Jurisdictions

Most law enforcement agencies report arrest and offence data to the Washington Association of Sheriffs and Police Chiefs (WASPC), which in turn provides data to the FBI's Uniform Crime Reporting Program. This is the source of our data. Some jurisdictions do not report all arrests and offenses, some report partial years, and some withhold certain categories of arrests or offenses. Reporting is voluntary for arrests and offenses. Offenses are more likely to be reported since some funding is associated with reporting. Offenses are incidence reporting. When more than one victim is involved an offence is filed for each victim. Multiple property violations performed at the same incident are counted as one offence.

However when both types of events happen, only the victim incidents are reported as offenses. Offenses focus on the nature of the crime, while arrests focus on the apprehended accused perpetrator. Many offenses occur without arresting perpetrators. Sometimes charges are dropped and sometimes no perpetrator is ever found. No perpetrator age can be assigned to offence data so the entire age range of population is used as the denominator. Some data is reported to UCR in a new system which is not yet compatible with UCR output reports and UCR cannot extract that data for this report but does include it in their reports to the FBI. We list those jurisdictions as non-reporting although UCR considers them to have reported. Only part one offenses are reported in the Uniform Crime Report, some agencies have no part one crimes to report. Those agencies are listed with zero events, not as non-reporting.

Information on the Non-reporting Population and Non-reporting Agencies are available only in the individual county and locale level reports. Each area report shows how and when that area's police jurisdictions reported data to the Washington Association of Sheriff's and Police Chiefs. If your area is one with jurisdictions having a significant amount of incomplete data, be very careful that you adjust your risk assessment to reflect this. In other words, the reported arrest rates may not adequately reflect the entire area. This will be true especially in those cases where the non-reporting police jurisdictions have either very high or very low arrest rates, compared to the rest of the area.

In order to compensate for missing police reports, we have adjusted the denominator in the rate calculation so that it reflects only the proportion of the area for which we do have data. For instance, say area A, with a population of 40,000, has eight police districts. Now, if one of the police districts in the area did not report their arrests, the number of arrests would not be representative of the whole area. Therefore, we would not want to use the population of the whole area in the denominator because that would make the rate lower than it should be. The solution used in this report is to subtract the population of that missing police district from the area population. We follow the same procedure for police districts that report partial years: if they report only six months, we use only half of the population to calculate the rate.

Due to the uneven geographic distribution of crime, missing police data can cause spikes or dips in the trend data comparison of multiple consecutive years. We do not run into this problem in the state report because the county rates there (as opposed to the individual county reports) only report 5-year averages. However for individual county reports and reports for smaller areas like locales or districts the trend data can become unstable due to non-reporting. Alternately, the conversion of data from certain police jurisdictions to other areas like locales may not apportion directly causing too much of the data to be apportioned based on population rather than clearly assigned to one area. We use a weighted reliability index (WRI) to determine when the conversion is no longer reliable. An explanation of that process follows. We have tried to compensate for these and other issues by suppressing data which is likely to be affected.

### Suppression Codes for Yearly Trend Data

**UN=Unreliable conversion** of events to report geography, failure of **weighted reliability index (WRI)**. The WRI evaluation process is further explained in the section labeled 'CORE-GIS Conversion Process and Weighted Reliability Index'.

**SP=Suppressed** by agreement with data provider when denominator is below agreed level and may compromise a person's rights to confidentiality.

**SN=Small Number Sample.** Geography has less than 30 events in the denominator. More reliable at 5 year level or for larger area.

**NR=Not reliable** due to non-reporting of police jurisdictions data. Fifty percent or more of the population is not represented by the data due to non-reporting jurisdictions.

## Counties Like Us

Knowing that your county has a particular rate for one of the indicators does not help you evaluate the importance of that indicator to your risk profile. You do not know if it is higher or lower than you could reasonably expect. It is more useful to compare your county rate to the state rate, which is the average for the whole state, and to other counties, especially counties that have some characteristics in common with your county. This is especially important when urban rates differ substantially from rural rates. The comparison we present is for a group of counties that are similar in characteristics related to prevention planning: population of young people (aged 10-24), the percentage of deaths in the county that are alcohol and drug-related, and a simple geographic division into Eastern and Western Washington. For each indicator the Counties Like Us rate is the average rate across all of the counties in the cluster.

The groupings for “Counties Like Us” are as follows:

Urban A\* – King County

Urban B\* – Pierce, Snohomish, and Spokane

Urban C – Benton, Clark, Kitsap, Thurston, Whatcom, and Yakima

Rural A – Ferry, Franklin, Grant, Klickitat, Okanogan, Pend Oreille, and Skamania

Rural B – Adams, Asotin, Chelan, Columbia, Douglas, Garfield, Kittitas, Lincoln, Stevens, Walla, and Whitman

Rural C – Clallam, Cowlitz, Grays Harbor, Island, Jefferson, Lewis, Mason, Pacific, San Juan, Skagit, Wahkiakum

\* For comparison, King County is compared to Urban B, but average scores for the indicators in Urban B do not include King County.

## Duplicated and Unduplicated Counts

In an unduplicated person count, each person is counted only once in a year for the specified activity or service type, even if they receive that service multiple times during the year. Examples include Temporary Assistance to Needy Families (TANF) Child Recipients, Food Stamp Recipients, and alcohol or drug treatment. Duplicated counts are made of events such as prison admissions, arrests, births, or admission to a hospital for attempted suicide. For instance, each time a person is admitted to a prison, that “event” is counted. Therefore, a person admitted more than once is included more than once in the total count.

## CORE-GIS Conversion Process and Weighted Reliability Index

CORE-GIS obtains data from many government agency sources. The data are represented as events (e.g. # of teen births, # of crimes, # of clients) occurring within a given geographic unit. This geographic unit is generally the smallest that can be obtained from the agency source. For example, data may be available by school district, by zip code, by census tract or by police jurisdictions. CORE-GIS calls these geographic units the “source geography.”

CORE-GIS data is usually reported at the geographic level of county or community – called in the rest of this report the “destination geography.” Therefore, data usually needs to be converted from the “source geographies” to the “destination geography.”

The conversion is based on an overlay process, in which the events occurring in small source geographies that are totally contained within the destination are combined with synthetic estimates of events occurring in source geographies that are partly within and partly outside the destination geography. The synthetic estimation is weighted by the population distribution between the source and destination areas. Therefore, it requires a small-scale count of the population underlying both source and destination geographies. This process is explained below through examples.

Data being converted from a smaller geography (source geography) like school district to a larger geography (like a county) is usually fairly reliable because most of the smaller pieces fit neatly and wholly into the new geography. (See example 1).

The rectangles represent two possible data source geographies (one densely populated school district – Urban School District -- and one thinly populated school district – Suburban School District -- surrounding it). The large oval represents a report's destination geography such as county, locale or network.

**Example 1**

The following statements refer to the first example:

All of the events occurring in the urban school district can be attributed entirely to the destination geography.

The events occurring in the split source geography (suburban school district, in this example) are distributed to the destination geography in the same proportion as the underlying population is distributed. If 40% of the suburban school district population lies within the destination geography, then 40% of its events are attributed to the destination geography.

These events are split by age, race and gender subgroups whenever possible, as are the populations. So the synthetic estimation is broken down that way also. If 40% of the young White population of the suburban school district lives in the destination geography, then 40% of the events occurring to young White people are attributed there. If, on the other hand, only 10% of the young American Indian population of the suburban school district lives in the destination geography, then only 10% of the events occurring to young American Indian people are attributed there.

While we can develop an algorithm to distribute all source geography populations to all destination geography populations, that distribution will not always be reliable.

For example, see the situation depicted in Example 2 below. Here we are trying to estimate the number of events contained in two very small destination geographies (the ovals). Could this synthetic estimate be reliable? Perhaps, if the small area within the ovals really is representative of the whole area -- but more likely not.

**Example 2**

A statistic is needed to assist researchers in determining when a destination geography's events cannot be reliably estimated using these processes. For CORE-GIS, that statistic is the Weighted Reliability Index (WRI).

The amount of overlap between source and destination populations can vary from less than 1% to 99% -- only a little of a source population can live in a destination, or almost all of the source population can live in a destination.

The key underlying assumption behind the CORE-GIS Weighted Reliability Index is as follows:

**When most of the population for the source geography is also in the destination geography, we can be more certain of the reliability of the estimation process.**

Therefore, the weighting process lets us calculate, for each source-geography/destination-geography combination, the reliability of each destination geography's estimate.

In the figure for Example 3, for zip code 2 the source area population is mostly in the destination oval (encased in the dashed line), but the majority population from the other contributing source area is not.

**Example 3**

The oval represents the destination geography boundary -- the edge of a destination city. The rectangles represent the source geography boundaries for two zip codes. The numbers are population of people living in each place: 10 people live both in Destination City and in the first source (Zip code 1), and 900 people live both in Destination City and in the second source (Zipcode2).

The formula for **Weighted Reliability Index** for a single destination is the total weighted destination population as a percent of total population. To understand this formula, see the calculations below.

	Percent of source population attributed to destination	Multiplied by the population attributed to the destination	Amount of destination
zip code 1	$10/80 = 12.5\%$	* 10	1.25
zip code 2	$900/1000 = 90\%$	* 900	810.00
<b>Total for Destination</b>		<b>910</b>	<b>811.25</b>

In the above example, the **Weighted Reliability Index** for Destination City is  $811.25 / 910 = 89\%$ . **Basically, 89% of the event locations were directly attributed to the area they occurred.** Along with the WRI a cut point for reliable reporting is needed. When half or more of the events have been imputed to the destination geography, rather than directly attributed from the source geography, the data is considered unreliable and rates are suppressed.

## WRI for Areas with Non-Reporting of Data

There is a second way that data may become unreliable. Some police jurisdictions do not report data to the state sources, use a reporting method which cannot be included in our files, fail to report for either adults or juveniles, or report for only part of a year. This is particularly true for court data – arrests or offenses. In order to accurately evaluate the reliability of data conversions for destination geographies containing those jurisdictions, non-reporting jurisdiction populations were excluded from the calculations for WRI and the non-reporting jurisdiction issue is evaluated separately.

Partial Reporting, part of a year or part of a population, is also taken into consideration when computing the percentage of non-reporting in a destination geography. Adult and juvenile rates are evaluated separately. Some areas may pass for one, but not for the other due to their reporting habits. For partial year reporting the percentage of the year with data reported is used to evaluate each category.

### Example 4

The second test of reliability is to determine whether the population for the rate is adequately represented. In this example, allow the numbers inside the oval to represent a population of 100 allocated to the destination geography. Two source jurisdictions are entirely located in the destination geography represented by the oval. Their events when reported would be directly attributed. The non-reporting jurisdiction would have its population of 50 excluded from the calculation for WRI, while the reporting jurisdiction would have its population included in the calculation. In this case the completely contained reporting jurisdiction would represent 30 of the remaining 50 population (60%) in the destination oval. The imputed portion is 40% allowing the destination geography to pass the first test for WRI.

CORE-GIS also requires that the excluded non-reporting jurisdiction population (50 of 100) are less than 50% of the total population for the destination geography. With an exclusion rate of 50%, this destination geography would fail the reliability criteria.

The reliability of arrest rates is calculated each year based on non-reporting. For five year rates, three out of five data years must be considered reliable by both tests and the average of the yearly WRI for all five years must reach the WRI cut point value.

## Rates: why is “raw data” converted to rates?

In order to make comparisons between counties and the state, and between counties that have different sizes, we use rates to describe an event in terms of a standard size population---either per 100 (percent), per 1,000 or per 100,000. For instance, what does it mean if County A has 42 alcohol retail licenses, and County B has 399? Does it mean that based on this indicator, the risk factor (Availability) is much higher in County B than it is County A? No, not if County B is a much bigger county. If County B is bigger, then the “rate” of liquor licenses per population might be the same or even lower. The only way to compare them is to convert the raw numbers to rates, based on the same population factor.

For instance:

County A: # of licenses – 42, # of persons (all ages) – 14, 297

County B: # of licenses – 399, # of persons (all ages) – 186,185

To calculate the rate per 1,000:

$42 / 14,297 = .002937$   $.002937 \times 1,000 = 2.94$

$399 / 186,185 = .002143$   $.002143 \times 1,000 = 2.14$

So the rate of alcohol retail licenses is 2.94 per 1,000 people in County A, and 2.14 per 1,000 people in County B.

## Standardization of CORE Indicators

An individual indicator by itself is interesting because you can compare your county (school district, locale) to all other counties (school districts, locales), and to the state. You can also look at how the indicator changes over time. But it is more difficult to compare several indicators to each other, for example, if you want to see which indicator of risk is extremely high and which is just average. For instance, you cannot directly compare the number (or rate) of alcohol retail licenses to the number (or rate) of Food Stamp recipients---this would be like comparing apples and oranges and would not be meaningful.

The preferred way to compare different indicators is to find out how much each individual indicator varies from some common point; in CORE reports the point we use is the indicator’s value for the state. In more technical terms, we transform the original absolute rates to a common scale: the relative deviation from the state rate. This is called a **standardized score**, and is based on the mathematical calculation of the standard deviation. For a particular indicator, the county (school district, locale) with the highest absolute rate will have the highest standardized score. A standardized score of 1.2, for instance, means that the county’s rate is 1.2 standard deviations above the state rate, and a –1.2 would be 1.2 standard measures *below* the state rate. Approximately 95% of all counties (school districts, locales) in the state will fall between +2 and –2 standard deviations from the state rate.

Here is an example. Let’s say an indicator for extreme family economic deprivation (Food Stamp recipients per 100 people) has a standardized score of 2.5 and an indicator for availability of drugs (alcohol retail licenses per 1,000 people) has a score of 1.2. We can say that, other things being equal, the county (school district, locale) in question has a higher risk for extreme family economic deprivation than for availability of drugs.

CORE indicators are standardized using a formula similar to the calculation of a z-score. A typical z-score for an observation (a county, a locale, a school district) is calculated as a difference between an observation and the mean (average) of all observations, divided by the standard deviation for all observations. A CORE standardized score for a county (school district, locale) is instead calculated using the state rate in place of the mean for all counties (school districts, locales). A standardized CORE indicator avoids the problem of using an unweighted mean of all counties (school districts, locales) that would give counties of very different size equal weight, and therefore provides a more meaningful comparison.

CORE standardized indicators for counties are calculated using the following formula. The same formula is used for locales and for districts, by substituting locale or district rates for county rates in the formula.

$$stdiz \_ score = \frac{county \_ rate - state \_ rate}{\sqrt{\frac{\sum_{i=1}^N (county \_ rate \_ i - state \_ rate)^2}{N}}}$$

## Where are the roadblocks to learning in our communities?

### Academic Achievement:

The CORE-GIS measures academic achievement using three groups of indicators:

1. student assessment on statewide tests;
2. students who graduate from high school;
3. students who drop out of high school, failing to complete their education.

### Student Assessment

The academic assessment indicators answer the question : "**What kind of progress have students been making in learning basic skill content areas needed for academic success?**". The indicators, *Poor Academic Performance in the Washington Assessment of Student Learning (WASL)*, are available for grades 4, 7 and 10. The indicators are calculated as a percentage of students tested in each grade assessment. Earlier years of information are from the Washington Assessment of Student Learning (WASL). In 2009-10 the WASL was replaced by the Measurements of Student Progress (MSP) for grades 3 through 8 and the High School Proficiency Exam (HSPE) for grade 10. Some districts have chosen to test students in both grades 9 and 10 for the 10th grade assessment, giving freshmen a second chance to pass the test. Passing the HSPE is essential for high-school graduation. Ninth graders who were tested are included with the tenth graders in the calculation of the Academic Achievement indicator for grade 10.

### Graduating from High School

The Washington State Board of Education establishes minimum credit requirements and requirements for the Culminating Project and the High School and Beyond Plan. The Washington State Legislature requires state testing. To earn a high school diploma, a student must:

- earn sufficient number of high school credits;
- pass state tests or approved alternatives to those tests;
- complete a Culminating Project;
- complete a High School and Beyond Plan.

Two types of high school graduation rates are listed in the CORE-GIS reports, *On-time Graduation* and *Extended Graduation* .

To graduate on-time, a student must graduate within four years by completion of the above listed graduation requirements. This indicator answers the question "**What percent of freshmen stayed in school and graduated in four years?**". The *On-Time Graduation rate* formula uses dropout rates discussed below; the formula is:  $100 * (1 - \text{grade 9 dropout rate}) * (1 - \text{grade 10 dropout rate}) * (1 - \text{grade 11 dropout rate}) * (1 - \text{grade 12 dropout rate} - \text{grade 12 continuing rate})$ . The on-time graduation rate is the inverse of the cumulative dropout rate with the senior class adjusted to remove those students who stay in school for more than four years from the calculation.

Extended Graduation is going the extra mile, and requires more resources and dedication from district staff. It includes those students who stay in school after their senior year and complete the graduation requirements. This indicator answers the question "**Do we go the extra distance to help students at risk graduate?**". Districts which have high extended graduation rates may also have poor dropout rates since the students attempting extended graduation are also at highest risk of again dropping out. A large difference in the size of the on-time and extended graduation rates may indicate that a district or school is working hard to keep students in school or to have dropouts return to school and attempt to graduate. The *Extended Graduation rate* formula is:  $(\text{the number of on-time and late graduates}) / (\text{the number of on-time graduates divided by the on-time graduation rate})$ .

### Dropping Out of High School

Two types of high school dropout rates are listed in the CORE-GIS reports, *Annual (Event) Dropouts* and *High School Cohort (Cumulative) Dropouts* .

The *Annual Dropout rate* measures the proportion of students enrolled in grades 9-12 who drop out in a single year without completing high school as a percentage of all students in grades 9 through 12. This indicator answers the question "**How many high-school students left school without graduating this year?**". When districts try new policies or projects to keep students in school the impact of those actions will be more immediately visible in this rate.

The *High School Cohort Dropout rate* (may also be referred to as the longitudinal, cumulative, or freshmen cohort dropout rate) measures what happens to a single group (or cohort) of students over a period of time. This indicator answers the question **"How many of the freshmen give up in the four years before their expected year of graduation?"**. This rate is most useful for seeing the long-term impact on the community. The Cohort (Cumulative) Dropout rate formula is:  $100 - (100 * (1 - \text{grade 9 dropout rate}) * (1 - \text{grade 10 dropout rate}) * (1 - \text{grade 11 dropout rate}) * (1 - \text{grade 12 dropout rate}))$ . The cohort rate is significantly higher than the annual rate for the same area as it measures the cumulative effect of the multiyear loss of students from their freshmen cohort.

Due to the complexity of the graduation and cohort dropout formulas numerators and denominators are not listed in the CORE-GIS reports. Formulas, definitions and requirements information has been taken primarily from the following report: Ireland, L. (2009), "Graduation and Dropout Statistics for Washington in 2007-08", Office of Superintendent of Public Instruction, Olympia, WA. This report and the formula components are available at the State of Washington Office of Superintendent of Public Instruction website, in the Research and Reports section, Data and Reports subsection, Graduation and Dropout Statistics for Washington's Counties, Districts, and Schools at:

<http://www.k12.wa.us/DataAdmin/default.aspx#dropoutgrad>.

Discussion of the difference between types of graduation and dropout rates was taken from: Camilla A. Lehr, David R. Johnson, Christine D. Bremer, Anna Cosio, Megan Thompson (May 2004). *Increasing Rates of School Completion Moving From Policy and Research to Practice, A Manual for Policymakers, Administrators, and Educators*. National Center on Secondary Education and Transition (NCSET):

<http://www.ncset.org/publications/essentialtools/dropout/default.asp> .

Although the focus of the NCSET website is students with disabilities, it has many broad-ranging articles with many useful ideas for educators and prevention workers.

### **School Climate:**

**"Do students feel safe in school?" "Are they expected and encouraged to attend school?"** Indicators listed under School Climate give an idea of how safe students may feel in their school or how committed they and their fellow students are to learning. These indicators are *Weapons Incidents in School* (rate per 1,000 students) and *Unexcused Absences for Students in Grades 1 to 8* (as a percentage of total student days possible in the school year, which equals the number of students times teaching days). When weapons incidents are common or it is acceptable for young students to frequently miss school without explanation the school climate is not conducive to learning.

### **Extreme Family Economic Deprivation:**

**"Are students too hungry to learn?"** Hungry students find it difficult to focus their attention long enough to learn. Those with inadequate housing or clothing may find it difficult to interact with their peers. There are three indicators which evaluate levels of poverty.

*Child Recipients of TANF (Temporary Assistance for Needy Families)* gives the rate of children from birth to 17 who receive income assistance. The child must be a citizen or legal alien and their caregiver must not have exceeded the 60 month maximum. There is a requirement for the adults to seek work and an income evaluation. Teen parents must attend school.

*Supplemental Nutrition Assistance Program (SNAP) Recipients*, formerly called Food Stamps shows a more generalized level of need. While the persons must be citizens or legal aliens who seek work and meet the income guidelines there is no cutoff time limit for benefits.

*Students Eligible for Free or Reduced Price Lunch* gives a much broader look at poverty in your area. Children of people who are "working poor", who have exceeded 60 months in benefits, are not legal aliens, or are not seeking work can still receive meals and free milk. The free guidelines are at or below 130 percent of the Federal poverty guidelines and the reduced price guidelines are between 130 and at or below 185 percent of the Federal poverty guidelines.

However, there are other ways to qualify. Many persons earning a gross income up to 200% of the Federal Poverty Level apply for income assistance because their children are automatically eligible for free school lunch if they meet the adjusted income guidelines. These are sometimes called \$0 grants. Households receiving assistance under SNAP, TANF for their children, Food Distribution Program on Indian Reservations (FDPIR) or, with children who are homeless, fostered, runaway, migrant, or in Head Start Programs are eligible for free benefits. If any child or household member receives benefits under Assistance Programs all children who are members of the household are eligible for free school meals.

**Walla Walla County**

**Populations subtracted for police agencies not reporting**

Police agencies are not required to report arrests or offences to UCR, they do so voluntarily. For a variety of reasons, a jurisdiction may report part or none of the arrests or offences for a year. In these cases, the denominator is the population of the areas that did report. For example, if juvenile arrests for one agency are not reported, the juveniles for that jurisdiction are not included in the population denominator either.

The tables below show the values that comprise the adjustment for your county for each age range we report. "% Subtracted" is the percent of the county's population subtracted for non-reporting. "Subtracted" is the amount subtracted. "Persons" is the locale's population. "Adjusted Pop" is the denominator used to calculate indicator rates. Nevertheless, rates can differ markedly from year to year particularly if a jurisdiction, where most of the crime in the county occurs, did not report. When 50% or more of the population is not reported the yearly rate is suppressed. Jurisdictions crossing county boundary lines are apportioned to each area by age, and sex of the population. When more than 40% of the reported events have been apportioned, "synthetically estimated", the yearly rate is suppressed.

All **Arrests** for 10-14 year olds have 5 year rates which represent **100.00** % of the population.

Adjustments for Non-reporting Arrests (age 10-14)

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
% Subtracted	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
